How to clean Heskins safety-grip

As safety-grip is an abrasive material, although safety-grip provides exceptional levels of grip it can be sometimes difficult to clean; the grit levels can accumulate debris and can damage unsuitable cleaning products. We recommend the following;

1. Do not use harsh cleaning materials, there is no need and they can impact the performance, we recommend either plain water or a simple cleaning solution.
2. Do not use rags, mops or floor buffers. A basic nylon brush works well. If something like a mop is used the abrasive surface will start to attack the mop making the surface look dirtier.
3. Apply just enough pressure and water to remove the debris, nothing more.
4. Wait to dry. Liquids will add to any potential slip risk.
